Platform Engineer with a background in System Administration and over 8 years of experience designing, evolving, and leading Kubernetes-based Internal Developer Platforms. Proven expertise in DevSecOps, SRE practices, Infrastructure as Code and GitOps. Strong focus on cloud-native technologies, cost optimization, developer experience, and continuous improvement.

Currently learning Japanese!

Professional Experience

Nov 2024 – Present. Remote

Infrastructure Engineer

Led critical modernization initiatives to evolve Scilife's insfrastructure and engineering practices as part of a transformation from a PHP monolith to a cloud-native, scalable platform on Kubernetes.

• Infrastructure-as-Code: Introduced Terraform as the standard, bringing ~80% of pre-existing cloud infrastructure under version control. Implemented collaborative, auditable workflows using GitHub Actions and Digger.

• Consolidated multiple resources under a single AWS Organization, decommissioning redundant infrastructure and reducing cloud spend by 50% over 9 months.

• Improved the company's security posture by migrating workforce access from IAM Users with long-lived credentials to AWS Identity Center integrated with Google Workspace SSO.

• Conducted a comprehensive engineering health assessment identifying systemic issues across architecture, delivery, security, and developer experience to support the creation of a remediation roadmap aligned with modern DevOps and engineering practices.

DevOps · Terraform · Kubernetes · AWS · EKS

Mar 2022 – Nov 2024. Remote

Staff Platform Engineer

Continue leading the evolution and roadmap of the Internal Developer Platform, nurturing a team around it as a tech lead while mentoring colleagues and teams on DevOps, SRE, and full-service ownership practices while working on organization-wide challenges.

• Optimized infrastructure utilization by migrating from Kubernetes Cluster Autoscaler to Karpenter, reducing costs by 40%.

• Enhanced API performance and reduced infrastructure costs by collaborating with application teams to implement caching policies in our CDN.

• Spearheaded the migration from PagerDuty to BetterUptime for incident response.

• Automated Terraform code quality and security checks using GitHub Actions.

• Deployed an internal JupyterHub platform to provide Jupyter Notebooks for Data Engineers and Data Scientists.

• Collaborated on designing a versatile solution to serve multiple Large Language Models using LiteLLM, switching seamlessly between them without requiring modifications to applications.

• Helped the team migrate the majority of workloads to ARM architecture for increased cost savings.

DevOps Terraform Kubernetes AWS EKS

Feb 2020 - Mar 2022. Hybrid

Senior Platform Engineer

As the company grew to +100 engineers, established the formation of the Platform Engineering Team as the next step in our DevOps journey; a team responsible for promoting DevOps practices at scale and addressing cross-cutting concerns by providing application teams with an Internal Developer Platform that they can leverage to develop, deploy and operate their apps in a self-service fashion.

• Led the creation and evolution of the Kubernetes-based Internal Developer Platform, leveraging AWS EKS, IaC and open source tooling like Rancher, ArgoCD, Harbor, Prometheus, Grafana, ElasticSearch... while integrating Single Sign-on + RBAC.

• Migrated workloads from AWS ECS to AWS EKS, using Helm charts and GitOps practices.

• Designed and implemented a cloud-agnostic solution for running Big Data Spark Jobs on our Kubernetes platform, leveraging the spark-operator, Argo Workflows, and autoscaling capabilities, migrating from a previous AWS EMR setup and reducing vendor lock-in.

• Simplified the company's AWS user management by leveraging AWS SSO and integrating Google Workspace as Identity Provider.

• Improved security posture by integrating AWS WAF.

• Drove infrastructure cost savings through increased use of spot instances.

• Developed opinionated Terraform modules with embedded best practices.

• Led the migration of legacy systems to modern, simpler & more maintainable alternatives, like moving from an in-house VPN solution to Tailscale.

DevOps Terraform Kubernetes AWS EKS

Nov 2016 - Feb 2020

DevOps Engineer

Being a small company of ~20 people I used to wear many hats without a clearly defined role and help where I could, ranging from office IT to managing cloud infrastructure and everything in between, but I always gravitated more to DevOps-related tasks from which I'd highlight:

• Migrated from Atlassian Bamboo to Jenkins for Continuous Integration; configuring pipelines as code with reusable libraries among projects.

• Integrated new tools like SonarQube into the CI/CD process to improve SDLC.

• Managed cloud resources with Terraform and implemented collaborative IaC workflows using Atlantis.

• Worked on migrating static websites to simpler, cheaper, and more reliable hosting using S3 + CloudFront.

• Containerized applications with Docker and orchestrated deployments with AWS ECS.

• Improved scalability and reliability of backend services by applying SRE practices and leveraging Prometheus, Grafana, and the Elastic Stack.

• Implemented auto-scaling on our backend services to automatically adjust the capacity based on demand.

• Played a key role in scaling infrastructure to support high traffic during major events like Black Friday, while reducing the manual steps involved in the process of dealing with subsequent large-scale events.

• Be part of an on-call rotation, resolving incidents and writing blameless post-mortems, figuring out root causes, and taking action to prevent them from happening again.

DevOps Terraform AWS

Education

Bachelor's Degree in Telecommunications Engineering at Universidad de Oviedo [2008 - 2013]
